## String edit distance

Data Structures and Algorithms for Computational Linguistics III (ISCL-BA-07)

Çağrı Çöltekin<br>ccoltekin@sfs.uni-tuebingen.de<br>University of Tübingen<br>Seminar für Sprachwissenschaft

Winter Semester 2020/21

## Edit distance

- In many applications, we want to know how similar (or different) two string are
- Comparing two files (e.g., source code)
- Comparing two DNA sequences
- Spell checking
- Approximate string matching
- Determining similarity of two languages
- Machine translation
- The solution is typically formulated as the (inverse) cost of obtaining one of the strings from the other through a number of edit operations
- Once we obtain the optimal edit operations, we may (depending on the edit operations) also be able to determine the optimal alignment between the strings

## Hamming distance

a simple distance metric between two sequences

- The Hamming distance measures number of different symbols in the corresponding positions

| h | y | g | i | e | n | e |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| h | i | g | i | e | n | e |

$0+1+0+0+0+0+0=1$

| h | y | g | i | e | n |  | e |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| h | i | y | g | e | i |  | n |

- Very easy/efficient calculation
- But cannot handle sequences of different lengths (consider hygene - hiygeine)

## A family of edit distance problems

- The same overall idea applies to a number of well-known problems/solutions that differ in the type of operations allowed
- Hamming distance: only replacements
- Longest common subsequence: (LCS) insertions and deletions
- Levenshtein distance insertions, deletions and substitutions
- Levenshtein-Damerau distance insertions, deletions and substitutions and transpositions (swap) of adjacent symbols
- Naive solutions to all (except Hamming distance) have exponential time complexity
- Polynomial-time solution can be obtained using dynamic programming

## Longest common subsequence (LCS)

## Problem definition

- A subsequence is an order-preserving (but not necessarily continuous) sequence of symbols from a string (a version of the sequence where zero or more elements are removed)
- hyg, gn, yene, hen, gene are subsequences of hygiene
- Note that a subsequence does not have to be a substring (substrings are continuous)
- hyg, giene, ene are substrings of hygiene
- The longest common substring (LCS) of two strings is the longest string that is a subsequence of both strings
- LCS(hygiene, hiygien) = hygien
- LCS(hygiene, hygeine) = hygine / hygene
- LCS is exactly the problem solved by the UNIX diff utility
- It has wide-ranging applications from source-code comparison to bioinformatics (e.g., DNA sequencing)

## LCS: a naive solution

- A simple solution is:

1. Enumerate all subsequences of the first string
2. Check if it is also a subsequence of the second string

- There are exponential number of subsequences of a string
- the string $a b c$ has 8 subsequences:
- abc: nothing removed
- $a b, a c, b c$ : individual elements are removed
- $a, b, c$ : length-2 subsequences are removed
- $\epsilon$ (empty string): abc removed
- For $a b c d$, we have subsequences of $a b c$ once with, and once without $d$
- Each additional symbol doubles the number of subsequences
- For strings of size $n$ and $m$, the complexity of the brute-force algorithm is $\mathrm{O}\left(2^{\mathrm{n}} \mathrm{m}\right)$

## LCS: recursive solution

## demonstration

- Consider two strings $X x, Y y$ and their $\operatorname{LCS} Z z(X, Y, Z$ are possibly empty strings, $x, y, z$ are characters)
- If $x=y$, then this character has to be part of the LCS, $x=y=z$, and $Z$ must be the LCS of $X$ and $Y$
- If $x \neq y$, there are three cases
$-x \neq y \neq z: Z z$ is also the LCS of $X$ and $Y$
$-x=z: Z z$ is also the LCS of $X x$ and $Y$
$-y=z: Z z$ is also the LCS of $X$ and $Y y$
- This leads to following recursive definition:

$$
\operatorname{LCS}(X x, Y y)= \begin{cases}\operatorname{LCS}(X, Y) x & \text { if } x=y \\ \text { longer of } \operatorname{LCS}(X x, Y) \text { and } \operatorname{LCS}(X, Y y) & \text { otherwise }\end{cases}
$$

## LCS: divide-and-conquer

- Note the repeated computaion

## LCS: dynamic programming

general sketch

- For string indexes $i$ and $j$, of strings $X$ and $Y$, if we need $\operatorname{LCS}\left(X_{i-1}, Y_{j-1}\right)$, $\operatorname{LCS}\left(X_{i-1}, Y_{j}\right), \operatorname{LCS}\left(X_{i 1}, Y_{j-}\right)$
- In the standard algorithm, we do not store the LCS, but the length of the LCS, $l_{i, j}$ for each $i, j$
- Once we fill in the matrix, the $l_{n, m}$ is the length of the LCS
- We can trace back and recover the LCS using the dynamic programming matrix

## LCS with dynamic programming

demonstration

|  |  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\epsilon$ | h | i | y | g | e | i | n | e |
| 0 | $\epsilon$ |  |  |  |  |  |  |  |  |  |
| 1 | h |  |  |  |  |  |  |  |  |  |
| 2 | y |  |  |  |  |  |  |  |  |  |
| 3 | g |  |  |  |  |  |  |  |  |  |
| 4 | i |  |  |  |  |  |  |  |  |  |
| 5 | e |  |  |  |  |  |  |  |  |  |
| 6 | n |  |  |  |  |  |  |  |  |  |
| 7 | e |  |  |  |  |  |  |  |  |  |

## LCS with dynamic programming

demonstration

|  |  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\epsilon$ | h | i | y | g | e | i | n | e |
| 0 | $\epsilon$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | h | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| 2 | y | 0 | 1 | 1 | 2 | 2 | 2 | 2 | 2 | 2 |
| 3 | g | 0 | 1 | 1 | 2 | 3 | 3 | 3 | 3 | 3 |
| 4 | i | 0 | 1 | 2 | 2 | 3 | 3 | 4 | 4 | 4 |
| 5 | e | 0 | 1 | 2 | 2 | 3 | 4 | 4 | 4 | 5 |
| 6 | n | 0 | 1 | 2 | 2 | 3 | 4 | 4 | 5 | 5 |
| 7 | e | 0 | 1 | 2 | 2 | 3 | 4 | 4 | 5 | 6 |

## Complexity of filling the LCS matrix

```
l = np.zeros(shape=(n+1,m+1))
for i in range(n):
    for j in range(m):
        if X[i] == Y[i]:
            l[i+1,j+1] = l[i,j] + 1
        else:
            l[i+1,j+1] = max(l[i+1,j], l[i, j+1])
```

- Two loops up to $n$ and $m$, the time complexity is $O(n m)$
- Similarly, the space complexity is also $\mathrm{O}(\mathrm{nm})$

## Recovering the LCS from the matrix

## Transforming one string to another

- The table (back arrows) also gives a set of edit operations to transform one string to anoter
- For LCS, opeartions are:
- copy (diagonal arrows in the demonstration)
- insert (left arrows in the demonstration - assuming original string is the vertical one)
- delete (up arrows in the demonstration - assuming original string is the vertical one)
- These also form an alignment between two strings
- Differnt set of edit operations recovered will yield the same LCS, but different alignments

## LCS alignments

Alignments:
h-yg-iene
ciccicdcc
hiygei-ne
h-ygie-ne
ciccdcicc
hiyg-eine

## LCS - some remarks

- We formulated the algorithm as optimizing the LCS
- Alternatively, we can consider costs assiciated with each operation:
- copy $=0$
- delete $=1$
- insert =1
- This is the typical application of LCS, as in diff
- In some applications we may want to have different costs for delete and insert (e.g., mapping lemmas to inflected forms of words)
- Similarly, we may want to assign different costs for different characters (e.g., higher cost to delete consonants in historical linguistics)

## Levenshtein distance

## definition

- Levenshtein difference between two strings is the total cost of insertions, deletions and substitutions
- With cost of 1 for all operations

$$
\operatorname{lev}(X x, Y y)= \begin{cases}\operatorname{len}(X) & \text { if } \operatorname{len}(Y y)=0 \\
\operatorname{len}(Y) & \text { if } \operatorname{len}(X x)=0 \\
\operatorname{lev}(X, Y) & \text { if } x=y \\
1+\min \left\{\begin{array}{l}
\operatorname{lev}(X, Y y) \\
\operatorname{lev}(X x, Y) \\
\operatorname{lev}(X, Y)
\end{array}\right. & \end{cases}
$$

- Naive recursion (as defined above), again, is intractable
- But, the same dynamic programming method works

## Levenshtein distance

demonstration

|  |  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\epsilon$ | h | i | y | g | e | i | n | e |
| 0 | $\epsilon$ |  |  |  |  |  |  |  |  |  |
| 1 | h |  |  |  |  |  |  |  |  |  |
| 2 | y |  |  |  |  |  |  |  |  |  |
| 3 | g |  |  |  |  |  |  |  |  |  |
| 4 | 1 |  |  |  |  |  |  |  |  |  |
| 5 | e |  |  |  |  |  |  |  |  |  |
| 6 | n |  |  |  |  |  |  |  |  |  |
| 7 | e |  |  |  |  |  |  |  |  |  |

## Levenshtein distance

demonstration

|  |  | ¢ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | h | i | y | g | e | i | n | e |
| 0 | $\epsilon$ |  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 1 | h | 1 | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| 2 | y | 2 | 1 | 1 | 1 | 2 | 3 | 4 | 5 | 6 |
| 3 | g | 3 | 2 | 2 | 2 | 1 | 2 | 3 | 4 | 5 |
| 4 | i | 4 | 3 | 2 | 3 | 2 | 2 | 2 | 3 | 4 |
| 5 | e | 5 | 4 | 3 | 3 | 3 | 2 | 3 | 3 | 3 |
| 6 | n | 6 | 5 | 4 | 4 | 4 | 3 | 3 | 3 | 4 |
| 7 | e | 7 | 6 | 5 | 5 | 5 | 4 | 4 | 4 | 3 |

## Levenshtein distance

edits and alignments

|  |  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\epsilon$ | h | i | y | g | e | i | n | e |
| 0 | $\epsilon$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 1 | h | 1 | 0 | -1 | 2 | 3 | 4 | 5 | 6 | 7 |
| 2 | y | 2 | 1 | 1 | ${ }^{1}$ | 2 | 3 | 4 | 5 | 6 |
| 3 | g | 3 | 2 | 2 | 2 | 1 | ${ }^{-2}$ | 3 | 4 | 5 |
| 4 | i | 4 | 3 | 2 | 3 | 2 | ${ }_{2}$ | ${ }_{2}$ | 3 | 4 |
| 5 | e | 5 | 4 | 3 | 3 | 3 | $2$ | $53$ | 3 | 3 |
| 6 | n | 6 | 5 | 4 | 4 | 4 | 3 | 3 | ${ }_{3}$ | 4 |
| 7 | e | 7 | 6 | 5 | 5 | 5 | 4 | 4 | 4 | 3 |

## Edit distance: extensions and variations

- Another possible operation we did not cover is swap (or transpose), which is useful for applications like spell checking
- In some applications (e.g., machine translation, OCR correction) we may want to have one-to-many or many-to-one alignments
- Additional requirements often introduce additional complexity
- It is sometimes useful to learn costs from data

## Summary

- Edit distance is an important problem in many fields including computational linguistics
- A number of related problems can be efficiently solved by dynamic programming
- Edit distance is also important for approximate string matching and alignment
- Reading suggestion: Goodrich, Tamassia, and Goldwasser (2013, chapter 13),Jurafsky and Martin (2009, section 3.11, or 2.5 in online draft)

Next:
