- For any regular language, there is a unique *minimal* DFA
- By finding the minimal DFA, we can also prove equivalence (or not) of different FSA and the languages they recognize
- In general the idea is:
 - Throw away unreachable states (*easy*)
 - Merge equivalent states
- There are two well-known algorithms for minimization:
 - Hopcroft's algorithm: find and eliminate equivalent states by partitioning the set of states
 - Brzozowski's algorithm: 'double reversal'

C. Çöltekin, INF | University of Tübingen

Winter Semester 2020/21 1/7

Finding equivalent states

Intuition

The edges leaving the group of nodes are identical.
Their *right languages* are the same.

Minimization by partitioning

- Accepting & non-accepting states form a partition
 $Q_1 = \{0, 1, 2, 3\}, Q_2 = \{4, 5\}$
- If any two nodes go to different sets for any of the symbols split
- $Q_1 = \{0, 3\}, Q_2 = \{1\}, Q_3 = \{2\}, Q_4 = \{4, 5\}$
- Stop when we cannot split any of the sets, merge the indistinguishable states

Winter Semester 2020/21 1/7

Minimization by partitioning

tabular version

- Create a state-by-state table, mark distinguishable pairs: (q_1, q_2) such that $\{ \Delta(q_1, x), \Delta(q_2, x) \}$ is a distinguishable pair for any $x \in \Sigma$

Minimization by partitioning

tabular version

- Create a state-by-state table, mark distinguishable pairs: (q_1, q_2) such that $(\Delta(q_1, x), \Delta(q_2, x))$ is a distinguishable pair for any $x \in \Sigma$

Minimization by partitioning

tabular version

- Create a state-by-state table, mark distinguishable pairs: (q_1, q_2) such that $(\Delta(q_1, x), \Delta(q_2, x))$ is a distinguishable pair for any $x \in \Sigma$

Minimization by partitioning

tabular version

- Create a state-by-state table, mark distinguishable pairs: (q_1, q_2) such that $(\Delta(q_1, x), \Delta(q_2, x))$ is a distinguishable pair for any $x \in \Sigma$

Minimization by partitioning

tabular version

- Create a state-by-state table, mark distinguishable pairs: (q_1, q_2) such that $(\Delta(q_1, x), \Delta(q_2, x))$ is a distinguishable pair for any $x \in \Sigma$

- Merge indistinguishable states

Minimization by partitioning

tabular version

- Create a state-by-state table, mark distinguishable pairs: (q_1, q_2) such that $(\Delta(q_1, x), \Delta(q_2, x))$ is a distinguishable pair for any $x \in \Sigma$

- Merge indistinguishable states
- The algorithm can be improved by choosing which cell to visit carefully

Brzozowski's algorithm

double reverse (r), determinize (d)

An exercise

find the minimum DFA for the automaton below

Minimization algorithms

final remarks

- There are many versions of the 'partitioning' algorithm. General idea is to form equivalence classes based on right-language of each state.
- Partitioning algorithm has $O(n \log n)$ complexity
- 'Double reversal' algorithm has exponential worst-time complexity
- Double reversal algorithm can also be used with NFAs (resulting in the minimal equivalent DFA - NFA minimization is intractable)
- In practice, there is no clear winner, different algorithms run faster on different input
- Reading suggestion: Hopcroft and Ullman (1979, Ch. 26&3), Jurafsky and Martin (2009, Ch. 2)

Next:

- PSA determinization, minimization
